

A. Write the following numbers in ordinary notation:

1)  $1 \times 10^5$  cm

2)  $1 \times 10^{-5}$  sec

3)  $2.56 \times 10^8$  ft<sup>3</sup>

4)  $73.89 \times 10^9$  BTU's

B. Express 55 mi/H in km/H

C. Express 720 in<sup>2</sup> in ft<sup>2</sup>

D. Express 6048 in<sup>3</sup> in ft<sup>3</sup>

E. At a cost of \$5.50 per square yard of material, how much will a person have to pay for a strip of material 4.0 feet wide by 20.0 feet long?

F. A water faucet has a cross sectional area of 1.500 in<sup>2</sup>. Suppose water flows from the faucet at a speed of 6.00 in/s. What volume of water flowing from the faucet during every second?

G. A horizontal force of 10.0 lbs. is exerted on a block in sliding it along a horizontal surface a distance of 7.2 ft. How much work has been done by the force?

H. A vertical force of 4.5 Newton is applied to a crate in order to lift it to a table 1.20 m high. How much work has been done by the force?

**Solution to Problem Set 1:** Usual rules: Please do not look at this until making an attempt (or using this to check your answer).

A. 1) 100,000 cm

3) 256,000,000 ft<sup>3</sup>

2) 0.00001 sec

4) 73,890,000,000 BTU's

B.  $1.6 \text{ km} = 1 \text{ mi}$  Hence,  $55 \frac{\text{mi}}{\text{H}} = \left( \frac{55 \text{ mi}}{1 \text{ H}} \right) * \left( \frac{1.6 \text{ km}}{1 \text{ mi}} \right) = 88 \frac{\text{km}}{\text{H}}$

C.  $144 \text{ in}^2 = 1 \text{ ft}^2$  Hence,  $720 \text{ in}^2 = \left( \frac{720 \text{ in}^2}{1} \right) * \left( \frac{1 \text{ ft}^2}{144 \text{ in}^2} \right) = 5.00 \text{ ft}^2$

D.  $1728 \text{ in}^3 = 1 \text{ ft}^3$  Hence,  $6048 \text{ in}^3 = \left( \frac{6048 \text{ in}^3}{1} \right) * \left( \frac{1 \text{ ft}^3}{1728 \text{ in}^3} \right) = 3.50 \text{ ft}^3$

E. The area of the material is 4.0 ft x 20.0 ft = 80 ft<sup>2</sup>;

However, 3 ft = 1 yd, or 9 ft<sup>2</sup> = 1 yd<sup>2</sup>;

$$\text{Cost} = 80 \text{ ft}^2 \left( \frac{1 \text{ yd}^2}{9 \text{ ft}^2} \right) * \left( \frac{\$5.50}{\text{yd}^2} \right) = \$49$$

F. This particular problem we have not determined how to do in class. However, one can deduce *from the units* ("dimensional analysis") how to work the problem from what is asked for in the problem—i.e. what volume (in<sup>3</sup>) is flowing per second(s)? Indeed the volume rate of flow can be determined by multiplying the speed (or velocity) times the area. Hence (6.00 in/sec)(1.500 in<sup>2</sup>) = 9.00 in<sup>3</sup>/sec

G.  $W = \text{Force} \times \text{distance} = (10.0 \text{ lbs})(7.2 \text{ ft}) = 72 \text{ ft. lbs.}$

H.  $W = \text{Force} \times \text{distance} = (4.5 \text{ N})(1.20 \text{ m}) = 5.4 \text{ joules}$
